

## Intro

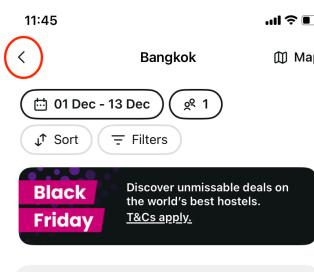

The app is called Hostel World, it's an app used by solo travellers to get guest houses or hostels to stay at in different parts of the world.

As a user I noticed a slight issue in the user experience, this is my attempt to explain that specific issue.

## Problem:

When you search for a city across the globe, you choose the dates then the amount of travelers, you get to a screen of hostels. The issue is that the screen only goes back to the main screen by pressing a button at the top left while other travel apps go back by a swiping motion.

This will cause frustration at the user side as the other travel apps usually have this swiping motion

## Insight:

The user got used to the main social media applications, they usually have this swiping motion to go back the screen before it, therefore if an application didn't have this swiping motion and has to press or tap on a button this might cause frustration at the user end and cause the smoothness of the app to go down.

## Solution:

I recommend adding this simple swiping motion to go back, along with the button, this will make the user experience smoother and align the app with standard motions learned by the user.
